

ABA WEBINAR EVENT

The Evolving Landscape of Temporary Wound Coverage

Clinical Evidence and Experience with PermeaDerm®

Human cadaveric allograft has long been used to provide temporary coverage prior to autografting; however, availability, cost, storage, and preparation time can pose limitations.

This webinar will explore the role of PermeaDerm, a temporary biosynthetic wound matrix, as a cost-effective alternative to allograft. The session will feature results from the PermeaDerm-I randomized controlled trial, including clinical outcomes, economic impact, and histological evaluation.

Attendees will gain perspective on how PermeaDerm supports wound temporization, offering a resource-conscious approach in staged wound management.

DATE:

Thursday, August 20, 2026

TIME:

3:00 PM - 4:00 PM CDT
